FAQs

1. What are the different types of expressions?

Ans: There are three types of expressions based on the position of operators: Infix, Prefix and Postfix.

2. Give examples of all types of expressions.

Ans:

- Infix: `a + b` — Operator is between operands.
- Prefix: `+ a b` — Operator is before operands.
- Postfix: `a b +` — Operator is after operands.

3. Which data structure is used for evaluation of expression?

Ans: Stack is used for expression evaluation. It follows the LIFO (Last In, First Out) principle and is commonly used for postfix and prefix evaluation.

4. Convert infix expression `a+b+c+d` to prefix expression.

Ans:

- Infix: `a + b + c + d`
- Prefix: `+++abcd`
- Operators are placed before operands.

5. Convert infix expression `a+b+c+d` to postfix expression.

Ans:

- Infix: `a + b + c + d`
- Postfix: `ab+c+d+`
- Operators are placed after operands.
